

Overview

Internal Assessment Sample C

Does news media regarding climate change have an effect on people's behaviour in Egypt?

Criterion	A	B	C	D	Total
Marks available	6	6	6	6	24
Marks awarded	3	3	2	2/3	12

Criterion A: Introduction

Aim is very broad and the real life problem is implicit but not directly addressed, and the population of the whole of Egypt is a huge population so less appropriate. The findings are marginally relevant (difficulty of changing behaviour and how to change behaviour) but not explained and linked to the investigation.

- *The aim is stated but not clearly expressed or is too broad. (1-2)*
- *The real-life problem is described, but the impact on the population of interest is not addressed.(3-4)*
- *Relevant findings and conclusions of two pieces of research are described or only one is explained and linked to the investigation.(3-4)*

3 marks

Criterion B: Research Methodology

There is minimal explanation of choice of method for this specific investigation -why a focus group? Some aspects of the procedure are described rather than explained. Controlling for gender differences is not highly relevant. The choice of participants is not explained. The sampling is unclear with contradictory information (the first 40 volunteers and then they would exclude all non-Egyptians). The reason for the film is not clear and destroying the film is not appropriate practice. Ethical considerations are not explained.

The research method is described with errors in understanding (1-2)

The procedure is described but lacks detail (3-4)

Relevant ethical considerations are described but some are not linked to the investigation (3-4)

3 marks

Criterion C : Data Collection

The data collection tool is not relevant to the behaviour that is being measured. There is no link to media. Challenges are generic and wrong in some cases: e.g. "so if people in one group do not show up for the interview, this could make our findings insignificant."

Discussion of "significance" is irrelevant to qualitative data.

- *An appropriate data collection tool has been created to measure behaviour, but it contains errors (1-2)*
- *Decisions made when creating the data collection tool are described and relevant to the aim or research question of the investigation. (3-4)*
- *Potential challenges when collecting data are described in limited detail and/or are not relevant to the investigation (1-2)*

2 marks

Criterion D Discussion

The implications are somewhat superficial but are described. Personal bias is relevant as researcher bias. An alternative method is identified and could be relevant, but the explanation is limited and sadly not explicitly linked to their area of investigation enough.

- *Potential findings of the investigation are described and the implication(s) for policy/practice are partially addressed.(3-4)*
- *One or more relevant examples of researcher bias are described (3-4).*
- *The usefulness of one relevant additional research method is described, without reference to increasing the understanding of the area of investigation. (1-2)*
